To:

The Commissioner,
Domestic Taxes / EFRIS & Digital Tax Services
Uganda Revenue Authority
Kampala, Uganda

RE: REQUEST FOR FULL SYSTEM-TO-SYSTEM INTEGRATION OF THE HOPE DESIGN ERP WITH URA SYSTEMS

Dear Sir/Madam,

Hope Design Group Ltd respectfully requests the Uganda Revenue Authority (URA) to approve and facilitate the **system-to-system integration of our Enterprise Resource Planning (ERP) system with the applicable URA digital tax systems and services, including the Electronic Fiscal Receipting and Invoicing Solution (EFRIS) and, where applicable, the Digital Tax Stamps (DTS) platform.**

Hope Design Group Ltd is a manufacturing and printing company whose operations include paper manufacturing, printing, security printing, finishing, packaging, warehousing, distribution and related commercial activities. We are implementing an integrated enterprise ERP designed to manage the company's complete operational, financial, manufacturing, inventory, procurement, sales, human resources and compliance processes.

Our objective is to establish a secure, auditable and reliable **ERP-to-URA system-to-system integration** through which transactions and tax-relevant information generated by our business operations can be processed in accordance with applicable URA requirements.

1. SCOPE OF THE PROPOSED INTEGRATION

The Hope Design ERP is being designed as the central operational system for the factory and will cover, among other areas:

- Procurement and supplier management
- Purchase orders and goods received notes
- Raw-material receiving and inventory
- Local and imported purchases
- Manufacturing and production orders
- Bills of materials (BOM)
- Work-in-progress (WIP)
- Finished-goods production
- Stock transfers and adjustments
- Batch and lot tracking
- Waste, scrap and production losses

- Warehouse management
- Sales orders and invoicing
- Delivery notes and dispatch
- Customer management
- Credit and debit notes
- Returns and cancellations
- Point-of-sale transactions where applicable
- Accounts receivable and payable
- General ledger and financial accounting
- VAT and other applicable tax calculations
- Tax reconciliation and reporting
- QR-based product and document traceability

We therefore request URA's guidance and approval on the appropriate integration architecture and the URA systems/APIs that should be integrated with these business processes.

2. EFRIS SYSTEM-TO-SYSTEM INTEGRATION

We specifically request access to the appropriate **EFRIS system-to-system/API integration facilities** for our ERP.

The proposed integration is intended to support, subject to URA's approved API capabilities and applicable tax requirements:

- EFRIS authentication
- Product and service master-data mapping
- Customer and taxpayer information
- Supplier information
- Purchase transactions
- Stock-in transactions
- Manufactured goods
- Local purchases
- Import-related transactions
- Sales transactions
- E-invoices
- E-receipts
- Credit notes
- Debit notes
- Invoice cancellation/adjustment
- Stock adjustments
- Stock transfers
- Fiscal Document Number (FDN) retrieval
- Verification codes
- QR/verification information
- EFRIS transaction status
- Error responses and validation messages
- Transaction reconciliation
- Retrieval and storage of relevant fiscal responses

All applicable URA fiscal identifiers and responses will be permanently linked to the corresponding ERP transaction for audit and reconciliation purposes.

3. DIGITAL TAX STAMPS / PRODUCTION INTEGRATION

Considering that Hope Design Group Ltd operates a manufacturing facility, we further request URA's technical guidance on whether any of our manufactured products and production processes fall within the applicable **Digital Tax Stamps (DTS)** requirements.

Where DTS integration is applicable, we request URA to provide the technical requirements and integration procedures necessary to connect the Hope Design ERP and relevant production systems with the DTS environment.

This may include, where applicable:

- Production-line integration
- Product identification
- Packaging information
- Production quantities
- Production events
- Batch/lot information
- Tax-stamp information
- Production-line equipment requirements
- Network requirements
- Secure communication requirements
- DTS API/interface specifications
- Production data transmission requirements

We would appreciate URA's confirmation of the specific DTS obligations applicable to our products before implementation.

4. API DOCUMENTATION AND TECHNICAL SPECIFICATIONS

We kindly request URA to provide the latest approved technical documentation required for integration, including where applicable:

- API documentation
- API endpoint specifications
- Authentication mechanisms
- API credentials requirements
- Request and response schemas
- Data dictionaries
- Product/tax-code requirements
- Error codes and error-handling procedures
- Rate limits
- Timeout and retry requirements
- Idempotency requirements
- Transaction status mechanisms
- QR/verification requirements
- Sandbox specifications
- Production specifications

- Versioning policy
- Change-management procedures
- Technical support/escalation procedures

5. SANDBOX / TEST ENVIRONMENT

We request access to a **URA EFRIS sandbox/test environment** to enable our technical team to develop and validate the integration before requesting production activation.

We propose to conduct controlled testing covering:

1. Authentication
2. Product registration/mapping
3. Customer validation
4. Purchase transactions
5. Stock-in
6. Manufacturing-related transactions where supported
7. Sales invoices
8. E-receipts
9. Credit notes
10. Debit notes
11. Cancellations/adjustments
12. Stock transfers
13. Stock adjustments
14. Invalid transaction handling
15. Duplicate transaction handling
16. Network failure and retry scenarios
17. Offline transaction synchronization
18. QR/verification
19. FDN processing
20. Reconciliation
21. Audit-trail verification

We request URA to advise on the formal **testing, User Acceptance Testing (UAT), certification and production-onboarding process**.

6. PRODUCTION ACCESS AND CREDENTIALS

Following successful sandbox testing and URA approval, we request production integration credentials and any required configuration, including:

- Production API credentials
- Client/application identifiers
- Authentication credentials/tokens
- Approved IP addresses
- IP whitelisting
- Digital certificates, where applicable
- Encryption requirements
- Webhook/callback configuration
- Production endpoints

- Any other security credentials required by URA

We undertake to securely store all credentials and restrict access to authorized technical personnel.

7. WEBHOOKS, CALLBACKS AND TRANSACTION STATUS

Where supported by URA, we request access to the appropriate mechanisms for receiving asynchronous transaction responses, notifications, status updates and other integration events.

The Hope Design ERP will maintain a transaction state machine to ensure that:

ERP Transaction → URA Submission → URA Response → Fiscal Status → Accounting/Reconciliation

is fully traceable.

Failed transactions will be placed into a controlled retry queue rather than being silently discarded.

8. SECURITY AND DATA PROTECTION

Hope Design Group Ltd recognizes that the proposed integration will involve sensitive business and taxpayer information.

Accordingly, the ERP integration architecture will implement appropriate security controls, including:

- Encrypted communications
- Secure API authentication
- Credential/secret management
- Role-based access control
- Privileged-access controls
- Audit logging
- Transaction-level traceability
- Network security
- IP restrictions where supported
- Database security
- Backup and disaster-recovery controls
- Monitoring and alerting
- Secure development practices
- Data-protection controls applicable under Ugandan law

URA's specific security requirements, authentication standards, certificates and approved integration controls will be incorporated into the final implementation.

9. ERP TAX RECONCILIATION

The Hope Design ERP will maintain a dedicated tax-reconciliation layer enabling the company to reconcile:

ERP Transactions ↔ EFRIS Transactions ↔ Accounting Records ↔ Tax Reports

The system will retain relevant URA transaction identifiers and responses against the originating business documents.

This will enable management and authorized compliance personnel to identify:

- Successful submissions
- Failed submissions

- Pending submissions
- Rejected transactions
- Corrected transactions
- Cancelled transactions
- Duplicate transactions
- Differences between ERP and EFRIS records
- Outstanding tax-related actions

10. OFFLINE AND BUSINESS CONTINUITY

Because factory operations cannot necessarily stop whenever external connectivity is unavailable, the ERP will incorporate controlled offline transaction queuing where permitted by URA requirements.

Transactions generated during temporary connectivity interruptions will be securely queued and synchronized according to the applicable URA/EFRIS rules.

We request URA's guidance on the permitted offline operating procedures, synchronization windows and any restrictions applicable to EFRIS transactions.

11. TECHNICAL CONTACT AND INTEGRATION TEAM

Hope Design Group Ltd will designate an authorized technical team to work with URA during the integration process.

The team will be responsible for:

- ERP development
- API integration
- Database architecture
- Security
- Testing
- UAT
- Deployment
- Monitoring
- Support
- Ongoing integration maintenance

12. REQUEST FOR URA TECHNICAL ONBOARDING

We therefore kindly request URA to:

1. Confirm Hope Design Group Ltd's applicable EFRIS obligations
2. Confirm the appropriate EFRIS system-to-system integration model
3. Provide the latest EFRIS API/technical documentation
4. Provide sandbox/test credentials
5. Provide the applicable data dictionaries and interface specifications
6. Advise on product and tax-code configuration
7. Advise on DTS applicability to our manufactured products
8. Provide DTS technical requirements where applicable
9. Provide production integration requirements

10. Provide IP-whitelisting requirements
11. Provide authentication and security requirements
12. Provide webhook/callback specifications where applicable
13. Guide us through integration testing and UAT
14. Certify/approve the completed integration where required
15. Issue production credentials and authorize production operation following successful compliance testing

13. OUR COMMITMENT

Hope Design Group Ltd is committed to implementing the integration in accordance with URA's technical, tax, security and compliance requirements.

We further commit that the ERP will not be designed to bypass, manipulate or interfere with URA fiscal controls. Instead, the system will provide a controlled and auditable mechanism for transmitting applicable transactions and retaining URA responses.

We would be grateful for the opportunity to engage URA's EFRIS/IT Integration team for a technical onboarding session so that our development team can obtain the required specifications and agree on the integration, testing and production-activation roadmap.

We look forward to URA's guidance and support.

Yours faithfully,

For and on behalf of HOPE DESIGN GROUP LTD
